

# Linear Copolymerisation in FORTRAN 2008

Daniel Celis Garza

November 6, 2015

The probability of reaction between monomers  $i$ ,  $j$  is calculated by dividing the speed at which monomers  $i$ ,  $j$  react by all possible reactions of  $i$  with other monomers

$$\begin{aligned} P_{ij} &= \frac{k_{ij}[i][j]}{\sum_{j=1}^N k_{ij}[i][j]} \\ P_{ij} &= \frac{k_{ij}[i][j]}{[i] \sum_{j=1}^N k_{ij}[j]} \\ P_{ij} &= \frac{k_{ij}[j]}{\sum_{j=1}^N k_{ij}[j]} \end{aligned} \tag{1}$$

where  $k \equiv$  reaction speed constant and  $[\dots]$  denotes concentration.
